INTERTRIGO refers to an inflammation of the body folds, which is usually located in the inner thighs, armpits, and underside of the breasts or belly. It is red and raw looking and may itch, ooze or be a little sore. Intertrigo is common, especially in hot humid climates. The condition is a frequent complication of diabetes or in those who are overweight; it also affects most infants as a component of diaper dermatitis. Keeping the folds cool and dry and eliminating any friction to the area is vital to improving this condition, absorbent powders, compresses with Burow's solution 1:40 dilute vinegar or wet tea bags often are and effective treatment, especially if followed by fanning or cool blow-drying. Where appropriate, antimycotic agents (miconazole, clotrimazole) can help, especially if used with a mild (class IV-VI) steroid for a short duration. Castellani paint (carbol-fuchsin paint) also can be beneficial. Formulations combining protective agents, antimicrobials, and topical steroids may be of use including the following: Triple Paste comprises petrolatum, zinc oxide paste, and aluminum acetate (Burow) solution applied. A thick coat of these protective barrier creams should be applied. Commercially available barrier pastes sold for diaper dermatitis (e.g., Desitin) can help, as can absorbent diapers.
